

Climate change

(Axe « sauver la planète, penser les futurs possibles »)

What affects the most our planet is climate change, which has become a crucial topic.

The US Impact

It has been proved that the United States is the second most polluting country in the world. It is the country that produces the most plastic trash on earth, masses of straws and plastic-made bags end up in the environment every year because less than 10% of those are recycled.

The importance of COPs

Many events and organizations against *climate change*¹ exist like COPs.

COP stands for Conference of the Parties and are huge international meetings where world leaders discuss how climate change affects our planet and try to find solutions to fight global warming. It first took place in March 1995 in

Berlin and the last one took place in November 2021 in Glasgow. In the last meeting, it was said that “the goal is to keep global warming below 2 degrees”.

The consequences

If we don't take action now, global warming and pollution will make the animals like polar bears and monkeys disappear but also plants, their environment and us. That is why we need to realize what is happening right now and has been for many years.

¹when the earth reaches a degree that it shouldn't; mostly caused by human activities and the industries that use gas all around the world
